

2 Megabit (128K x 16-Bit) Multi-Purpose Flash

SST39VF200

Advance Information

FEATURES:

- **Organized as 128K x16**
- **Single 2.7-3.6V Read and Write Operations**
- **Superior Reliability**
 - Endurance: 100,000 Cycles (typical)
 - Greater than 100 years Data Retention
- **Low Power Consumption:**
 - Active Current: 15 mA (typical)
 - Standby Current: 10 μ A (typical)
 - Auto Low Power Mode: 10 μ A (typical)
- **Small Sector-Erase Capability (64 sectors)**
 - Uniform 2 KWord sectors
- **Block-Erase Capability (4 blocks)**
 - Uniform 32 KWord blocks
- **Fast Read Access Time:**
 - 70 and 90 ns
- **Latched Address and Data**
- **Fast Erase and Word-Program:**
 - Sector-Erase Time: 18 ms (typical)
 - Block-Erase Time: 18 ms (typical)
 - Chip-Erase Time: 70 ms (typical)
 - Word-Program Time: 14 μ s (typical)
 - Chip Rewrite Time: 2 seconds (typical)
- **Automatic Write Timing**
 - Internal V_{PP} Generation
- **End of Write Detection**
 - Toggle Bit
 - Data# Polling
- **CMOS I/O Compatibility**
- **JEDEC Standard**
 - Flash EEPROM Pinouts and command sets
- **Packages Available**
 - 48-Pin TSOP (12mm x 20mm)

PRODUCT DESCRIPTION

The SST39VF200 device is a 128K x16 CMOS Multi-Purpose Flash (MPF) manufactured with SST's proprietary, high performance CMOS SuperFlash technology. The split-gate cell design and thick oxide tunneling injector attain better reliability and manufacturability compared with alternate approaches. The SST39VF200 writes (Programs or Erases) with a 2.7-3.6V power supply. The SST39VF200 conforms to JEDEC standard pinouts for x16 memories.

Featuring high performance Word-Program, the SST39VF200 device provides a typical Word-Program time of 14 μ sec. The entire memory can typically be erased and programmed word-by-word in 2 seconds, when using interface features such as Toggle Bit or Data# Polling to indicate the completion of the Program operation. To protect against inadvertent write, the SST39VF200 has on-chip hardware and software data protection schemes. Designed, manufactured, and tested for a wide spectrum of applications, the SST39VF200 is offered with a guaranteed endurance of 10,000 cycles. Data retention is rated at greater than 100 years.

The SST39VF200 device is suited for applications that require convenient and economical updating of program, configuration, or data memory. For all system applications, the SST39VF200 significantly improves performance and reliability, while lowering power consumption. The SST39VF200 inherently uses less energy during Erase and Program than alternative flash tech-

nologies. When programming a flash device, the total energy consumed is a function of the applied voltage, current, and time of application. Since for any given voltage range, the SuperFlash technology uses less current to program and has a shorter erase time, the total energy consumed during any Erase or Program operation is less than alternative flash technologies. The SST39VF200 also improves flexibility while lowering the cost for program, data, and configuration storage applications.

The SuperFlash technology provides fixed Erase and Program times, independent of the number of Erase/Program cycles that have occurred. Therefore the system software or hardware does not have to be modified or de-rated as is necessary with alternative flash technologies, whose Erase and Program times increase with accumulated Erase/Program cycles.

To meet surface mount requirements, the SST39VF200 is offered in a 48-pin TSOP package. See Figure 1 for pinout.

Device Operation

Commands are used to initiate the memory operation functions of the device. Commands are written to the device using standard microprocessor write sequences. A command is written by asserting WE# low while keeping CE# low. The address bus is latched on the falling edge of WE# or CE#, whichever occurs last. The data bus is latched on the rising edge of WE# or CE#, whichever occurs first.

The SST39VF200 also has the **Auto Low Power** mode which puts the device in a near standby mode after data has been accessed with a valid Read operation. This reduces the I_{DD} active read current from typically 15 mA to typically 200 μ A. The Auto Low Power mode reduces the typical I_{DD} active read current to the range of 1 mA/MHz of read cycle time. The device exits the Auto Low Power mode with any address transition or control signal transition used to initiate another read cycle, with no access time penalty.

Read

The Read operation of the SST39VF200 is controlled by CE# and OE#, both have to be low for the system to obtain data from the outputs. CE# is used for device selection. When CE# is high, the chip is deselected and only standby power is consumed. OE# is the output control and is used to gate data from the output pins. The data bus is in high impedance state when either CE# or OE# is high. Refer to the Read cycle timing diagram for further details (Figure 2).

Word-Program Operation

The SST39VF200 is programmed on a word-by-word basis. The Program operation consists of three steps. The first step is the three-byte load sequence for Software Data Protection. The second step is to load word address and word data. During the Word-Program operation, the addresses are latched on the falling edge of either CE# or WE#, whichever occurs last. The data is latched on the rising edge of either CE# or WE#, whichever occurs first. The third step is the internal Program operation which is initiated after the rising edge of the fourth WE# or CE#, whichever occurs first. The Program operation, once initiated, will be completed within 20 μ s. See Figures 3 and 4 for WE# and CE# controlled Program operation timing diagrams and Figure 15 for flowcharts. During the Program operation, the only valid reads are Data# Polling and Toggle Bit. During the internal Program operation, the host is free to perform additional tasks. Any commands issued during the internal Program operation are ignored.

Sector/Block-Erase Operation

The Sector/Block-Erase operation allows the system to erase the device on a sector-by-sector (or block-by-block) basis. The SST39VF200 offers both small Sector-Erase and Block-Erase mode. The sector architecture is based on uniform sector size of 2 KWord. The Block-Erase mode is based on uniform block size of 32 KWord. The Sector-Erase operation is initiated by executing a six-byte command sequence with Sector-Erase command (30H) and sector address (SA) in the last bus cycle. The address lines A11-A16 are used to determine the sector address. The Block-Erase operation is initiated by executing a six-byte command sequence with Block-Erase command (50H)

and block address (BA) in the last bus cycle. The address lines A15-A16 are used to determine the block address. The sector or block address is latched on the falling edge of the sixth WE# pulse, while the command (30H or 50H) is latched on the rising edge of the sixth WE# pulse. The internal Erase operation begins after the sixth WE# pulse. The end of Erase operation can be determined using either Data# Polling or Toggle Bit methods. See Figures 8 and 9 for timing waveforms. Any commands issued during the Sector or Block-Erase operation are ignored.

Chip-Erase Operation

The SST39VF200 provides a Chip-Erase operation, which allows the user to erase the entire memory array to the "1" state. This is useful when the entire device must be quickly erased.

The Chip-Erase operation is initiated by executing a six-byte command sequence with Chip-Erase command (10H) at address 5555H in the last byte sequence. The Erase operation begins with the rising edge of the sixth WE# or CE#, whichever occurs first. During the Erase operation, the only valid read is Toggle Bit or Data# Polling. See Table 4 for the command sequence, Figure 7 for timing diagram, and Figure 18 for the flowchart. Any commands issued during the Chip-Erase operation are ignored.

Write Operation Status Detection

The SST39VF200 provides two software means to detect the completion of a write (Program or Erase) cycle, in order to optimize the system write cycle time. The software detection includes two status bits: Data# Polling (DQ₇) and Toggle Bit (DQ₆). The end of write detection mode is enabled after the rising edge of WE#, which initiates the internal Program or Erase operation.

The actual completion of the nonvolatile write is asynchronous with the system; therefore, either a Data# Polling or Toggle Bit read may be simultaneous with the completion of the write cycle. If this occurs, the system may possibly get an erroneous result, i.e., valid data may appear to conflict with either DQ₇ or DQ₆. In order to prevent spurious rejection, if an erroneous result occurs, the software routine should include a loop to read the accessed location an additional two (2) times. If both reads are valid, then the device has completed the write cycle, otherwise the rejection is valid.

Data# Polling (DQ₇)

When the SST39VF200 is in the internal Program operation, any attempt to read DQ₇ will produce the complement of the true data. Once the Program operation is completed, DQ₇ will produce true data. The device is then ready for the next operation. During internal Erase operation, any attempt to read DQ₇ will produce a '0'. Once the internal

2 Megabit Multi-Purpose Flash SST39VF200

Advance Information

Erase operation is completed, DQ7 will produce a '1'. The Data# Polling is valid after the rising edge of fourth WE# (or CE#) pulse for Program operation. For Sector, Block or Chip-Erase, the Data# Polling is valid after the rising edge of sixth WE# (or CE#) pulse. See Figure 5 for Data# Polling timing diagram and Figure 16 for a flowchart.

Toggle Bit (DQ₆)

During the internal Program or Erase operation, any consecutive attempts to read DQ₆ will produce alternating 1's and 0's, i.e., toggling between 1 and 0. When the internal Program or Erase operation is completed, the DQ₆ bit will stop toggling. The device is then ready for the next operation. The Toggle Bit is valid after the rising edge of fourth WE# (or CE#) pulse for Program operation. For Sector, Block or Chip-Erase, the Toggle Bit is valid after the rising edge of sixth WE# (or CE#) pulse. See Figure 6 for Toggle Bit timing diagram and Figure 16 for a flowchart.

Data Protection

The SST39VF200 provides both hardware and software features to protect nonvolatile data from inadvertent writes.

Hardware Data Protection

Noise/Glitch Protection: A WE# or CE# pulse of less than 5 ns will not initiate a write cycle.

V_{DD} Power Up/Down Detection: The Write operation is inhibited when V_{DD} is less than 1.5V.

Write Inhibit Mode: Forcing OE# low, CE# high, or WE# high will inhibit the Write operation. This prevents inadvertent writes during power-up or power-down.

Software Data Protection (SDP)

The SST39VF200 provides the JEDEC approved Software Data Protection scheme for all data alteration operations, i.e., Program and Erase. Any Program operation requires the inclusion of the three-byte sequence. The three-byte load sequence is used to initiate the Program operation, providing optimal protection from inadvertent Write operations, e.g., during the system power-up or power-down. Any Erase operation requires the inclusion of six-byte sequence. The SST39VF200 device is shipped with the Software Data Protection permanently enabled. See Table 4 for the specific software command codes. During SDP command sequence, invalid commands will abort the device to Read mode within T_{RC}. The contents of DQ₁₅-DQ₈ are "Don't Care" during any SDP command sequence.

Common Flash Memory Interface (CFI)

The SST39VF200 also contains the CFI information to describe the characteristics of the device. In order to enter the CFI Query mode, the system must write three-byte sequence, same as Software ID Entry command with 98H (CFI Query command) to address 5555H in the last byte sequence. Once the device enters the CFI Query mode, the system can read CFI data at the addresses given in tables 5 through 7. The system must write the CFI Exit command to return to Read mode from the CFI Query mode.

Product Identification

The Product Identification mode identifies the device as the SST39VF200 and manufacturer as SST. This mode may be accessed by hardware or software operations. The hardware operation is typically used by a programmer to identify the correct algorithm for the SST39VF200. Users may wish to use the Software Product Identification operation to identify the part (i.e., using the device code) when using multiple manufacturers in the same socket. For details, see Table 3 for hardware operation or Table 4 for software operation, Figure 10 for the Software ID Entry and Read timing diagram and Figure 17 for the Software ID Entry command sequence flowchart.

TABLE 1: PRODUCT IDENTIFICATION TABLE

	Address	Data
Manufacturer's Code	0000H	00BFH
Device Code	0001H	2789H

360 PGM T1.0

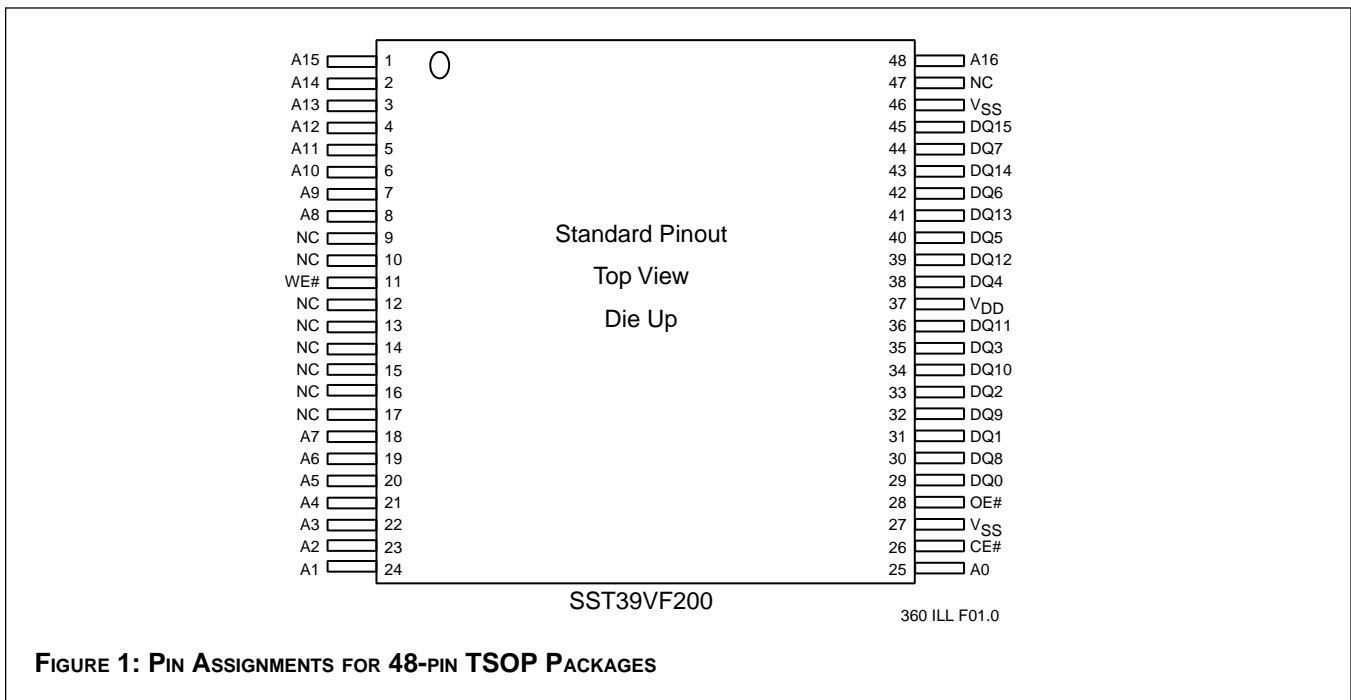

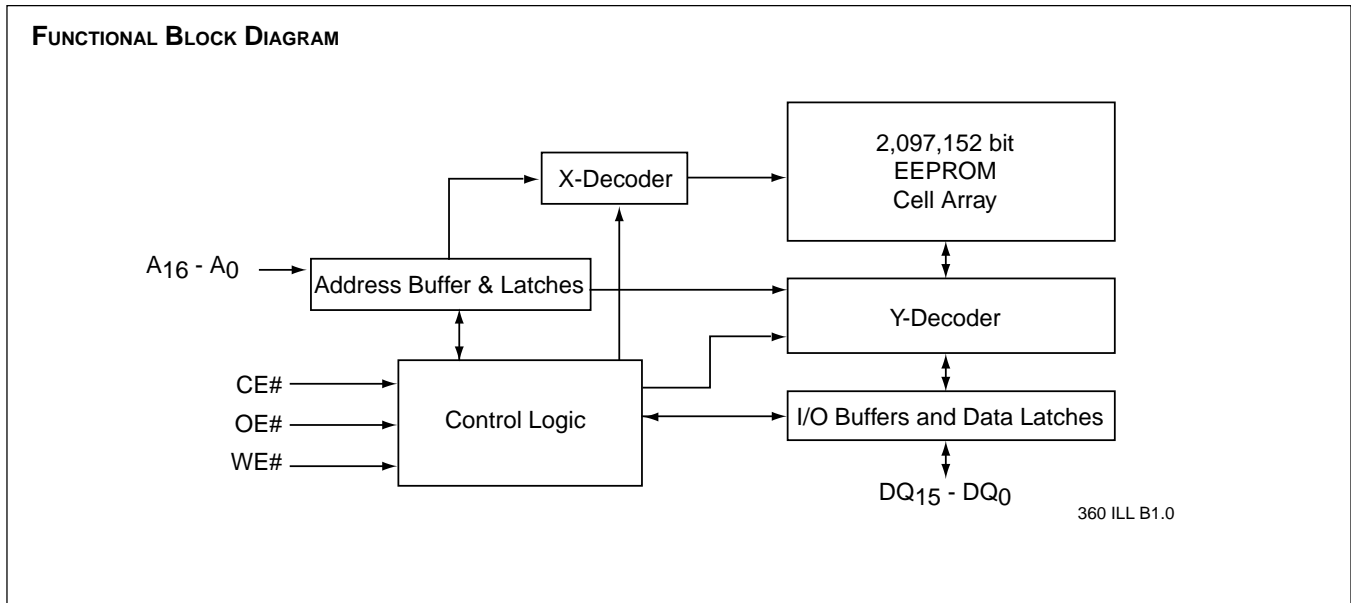

Product Identification Mode Exit/CFI Mode Exit

In order to return to the standard Read mode, the Software Product Identification mode must be exited. Exit is accomplished by issuing the Software ID Exit command sequence, which returns the device to the Read operation. This command may also be used to reset the device to the Read mode after any inadvertent transient condition that apparently causes the device to behave abnormally, e.g., not read correctly. Please note that the Software ID Exit/CFI Exit command is ignored during an internal Program or Erase operation. See Table 4 for software command codes, Figure 12 for timing waveform and Figure 17 for a flowchart.

TABLE 2: PIN DESCRIPTION

Symbol	Pin Name	Functions
A ₁₆ -A ₀	Address Inputs	To provide memory addresses. During Sector-Erase A ₁₆ -A ₁₁ address lines will select the sector. During Block-Erase A ₁₆ -A ₁₅ address lines will select the block.
DQ ₁₅ -DQ ₀	Data Input/output	To output data during read cycles and receive input data during write cycles. Data is internally latched during a write cycle. The outputs are in tri-state when OE# or CE# is high.
CE#	Chip Enable	To activate the device when CE# is low.
OE#	Output Enable	To gate the data output buffers.
WE#	Write Enable	To control the Write operations.
V _{DD}	Power Supply	To provide 3-volt supply (2.7-3.6V)
V _{SS}	Ground	
NC	No Connection	Unconnected pins.

360 PGM T4.0

- Notes:**
- (1) Address format A₁₄-A₀ (Hex), Addresses A₁₅ and A₁₆ are "Don't Care" for Command sequence.
 - (2) SA_x for Sector-Erase; uses A₁₆-A₁₁ address lines
BA_x, for Block-Erase; uses A₁₆-A₁₅ address lines
 - (3) WA = Program word address
 - (4) Both Software ID Exit operations are equivalent
 - (5) DQ₁₅ - DQ₈ are "Don't Care" for Command sequence

Notes for Software ID Entry Command Sequence

1. With A₁₆ -A₁ =0; SST Manufacturer Code = 00BFH, is read with A₀ = 0,
SST39VF200 Device Code = 2789H, is read with A₀ = 1.
2. The device does not remain in Software Product ID Mode if powered down.

2 Megabit Multi-Purpose Flash SST39VF200

Advance Information

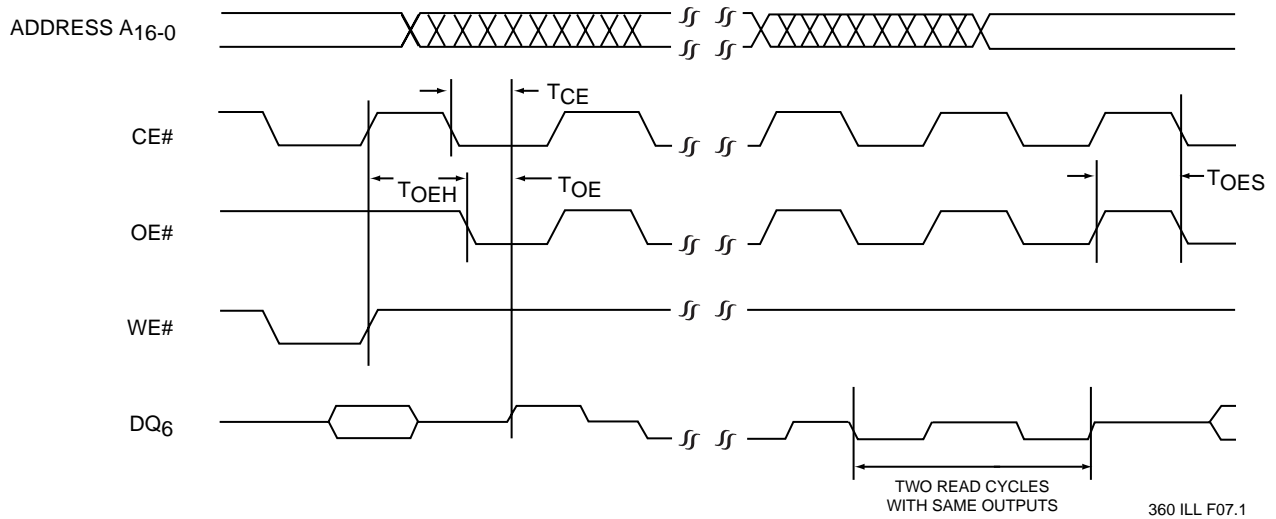

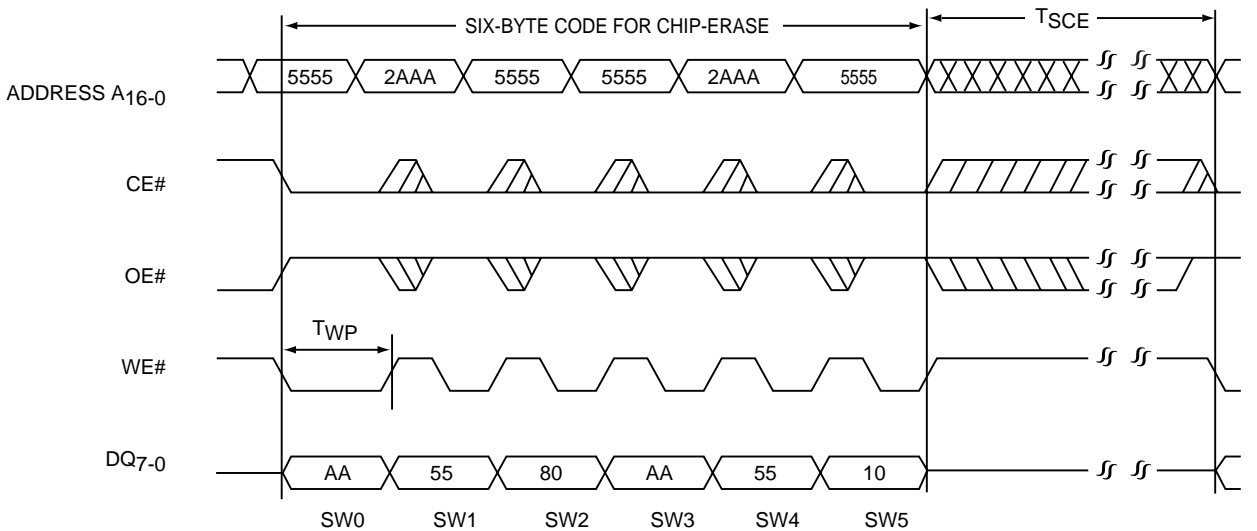

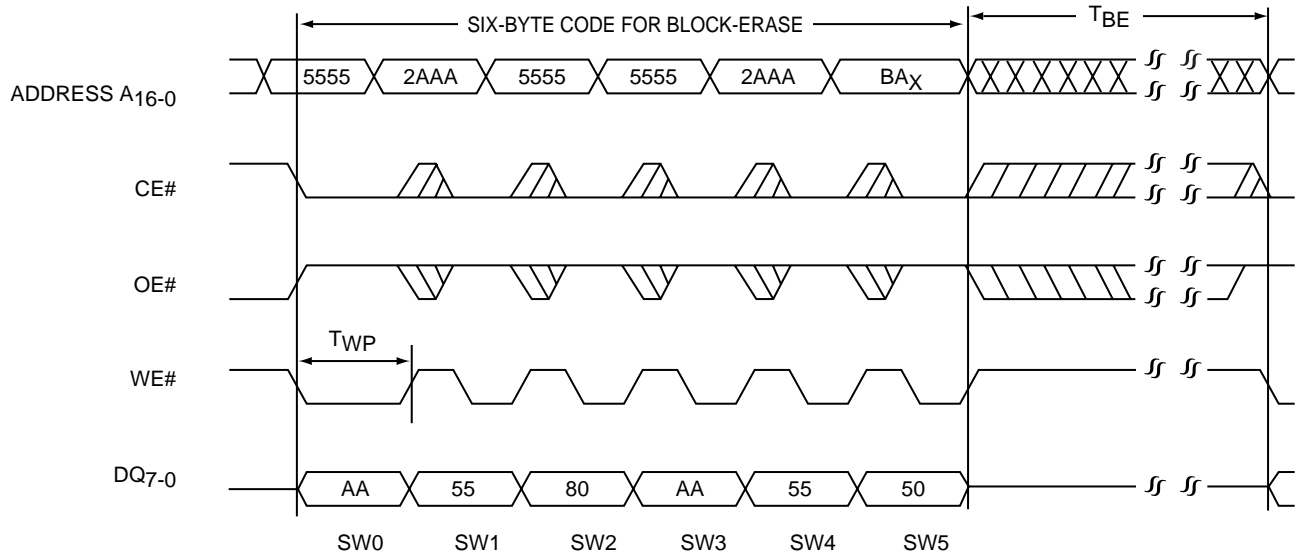

FIGURE 6: TOGGLE BIT TIMING DIAGRAM

Note: This device also supports CE# controlled Chip-Erase operation. The WE# and CE# signals are interchangeable as long as minimum timings are met. (See Table 13)

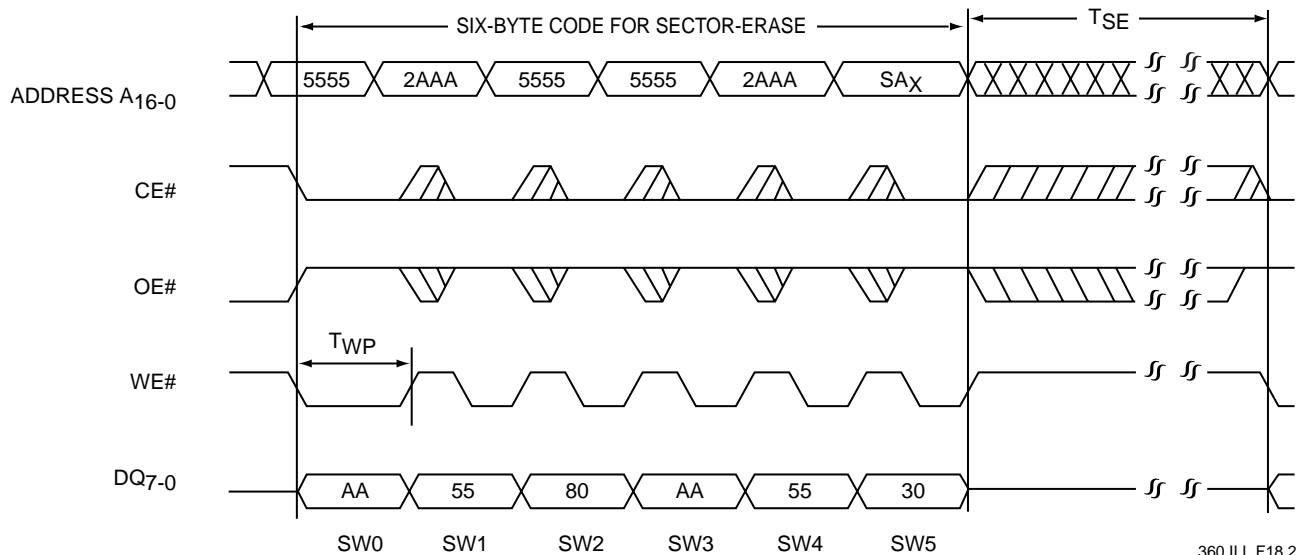

FIGURE 7: WE# CONTROLLED CHIP-ERASE TIMING DIAGRAM

Note: This device also supports CE# controlled Block-Erase operation. The WE# and CE# signals are interchangeable as long as minimum timings are met. (See Table 13)
BA_x = Block Address

360 ILL F17.3

FIGURE 8: WE# CONTROLLED BLOCK-ERASE TIMING DIAGRAM

Note: This device also supports CE# controlled Sector-Erase operation. The WE# and CE# signals are interchangeable as long as minimum timings are met. (See Table 13)
SA_x = Sector Address

Advance Information

SST39VF200 Valid combinations

SST39VF200-70-4C-EK

SST39VF200-90-4C-EK

ST39VF200-90-4C-U1

SST39VF200-70-4I-EK

SST39VF200-90-4I-EK

Example : Valid combinations are those products in mass production or will be in mass production. Consult your SST sales representative to confirm availability of valid combinations and to determine availability of new combinations.
